

Economic Contribution of Agricultural and Forestry Production and Processing in Mississippi: An Input-Output Analysis (2022 Data)

Agriculture and forestry are major drivers of Mississippi's economy. In 2022, the agricultural and forestry production and processing sectors directly accounted for 120,159 jobs, paying \$6 billion in wages and salaries (Table 1). Additionally, agriculture- and forestry-related sectors directly accounted for \$33.42 billion in sales, with a value-added generation of \$9.34 billion. Value-added refers to industry sales minus input costs.

These contributions to Mississippi's economy are significant, even before accounting for their indirect stimulative effects. The agricultural and forestry industries and their employees spend their revenues and wages within other Mississippi industries, resulting in an even larger total economic benefit from these sectors. The estimated results of a more extensive total economic contribution analysis, including the stimulative spending effect, demonstrate a much greater benefit to the Mississippi economy, amounting to 185,774 jobs paying \$9.2 billion in wages and salaries; associated sales of \$46.17 billion generated a value-added of \$15.43 billion (Table 2).

This report focuses on the total economic contribution resulting from Mississippi's agricultural and forestry production and processing activities. Furthermore, it describes the methodology used to estimate the total economic contribution of Mississippi's agricultural and forestry sectors. The authors used available data on the value of production (e.g., agricultural commodities and timber harvests) and production values of secondary agricultural and forest product processing (e.g., poultry processing and lumber mills) that produce value-added products to estimate the total economic contribution.

Methods

Agricultural and forestry production and processing activities are intertwined within the Mississippi economy as the production process (direct effect) involves purchases from other sectors of the economy (indirect effect), and the employees of both agricultural and non-agricultural businesses also make household purchases (induced effect) that have a further stimulative effect on the Mississippi economy.

The total economic contribution is the sum of direct, indirect, and induced effects. Direct effects represent the economic activity from businesses defined to belong in agriculture and forestry (i.e., producers, processors, and agricultural support services). Indirect effects represent the economic activity from businesses and organizations not traditionally thought of as agriculture-related (e.g., transportation, utilities, and insurance) but that supply goods and services to agricultural businesses that are needed in the production process. Indirect effects are a basic response to agricultural activities and reflect the interdependence between businesses and industries throughout the economy. Induced effects simply reflect household spending of the wages and salaries that were made possible by the value-added generation that starts with the agricultural and forestry production and processing sectors.

Each industry that produces goods and services generates demands for other goods and services, and input-output models estimate multipliers that quantify these cycles of re-spending in the economy. The total economic contribution of agricultural and forestry production and processing (direct, indirect, and induced effects) can be estimated by removing or extracting these sectors from the modeled economy. By comparing the resulting effects on the Mississippi economy, this reveals the multiplier effects of these removed sectors, allowing for a better understanding of the relationships between the sectors of interest and the rest of the economy.

The result of this "extraction" demonstrates the removed contribution to the rest of the economy, which is an estimate of how much economic activity is supported by these sectors. Agricultural and forestry production and processing sectors of the Mississippi economy purchase goods and services from other sectors to produce their products. These industry purchases of goods and services are referred to as backward linkages. For example, the backward linkages of a lumber mill would be purchases of goods and services such as timber, utilities, parts, transportation, and labor. It is this multiplier effect of backward linkages that is traced by using input-output models.

Software used for this analysis is a well-known input-output modeling system called Impact Analysis for

Planning (IMPLAN), which is updated annually by the IMPLAN Group LLC. IMPLAN is a computerized database and modeling system for constructing regional economic accounts and regional input-output tables. The IMPLAN 546 sector input-output model is based primarily on data from the U.S. Bureau of Economic Analysis, U.S. Bureau of Labor Statistics, U.S. Census Bureau, U.S. Department of Agriculture, and U.S. Geological Survey. This study used an input-output model constructed with IMPLAN software and the most recent 2022 IMPLAN data.

For reporting purposes, this study combines the 546 sectors into 31 aggregated sectors—13 agricultural and forestry sectors and 18 sectors representing the rest of the Mississippi economy (Table A.1). The 13 agricultural and forestry production and processing sector groups include agricultural support activities, cattle and dairy, commercial fishing and wildlife, cotton farms, food and fiber products, soybean farms, grain farms, logging, other animal production (hogs, horses, and aquaculture), other farms (vegetable and melon), poultry and egg, wood and paper products, and wood furniture manufacturing.

The economic contribution of agriculture- and forestry-related sectors in Mississippi can be measured by four key statistics:

- employment: the number of full- and part-time jobs in the sector.
- wages and salaries: employee compensation including total payroll costs and benefits and proprietary income.
- output: the sector's total value of production.
- value-added: total sector output minus the costs of purchased inputs.

Results

The agricultural and forestry production and processing sectors had a substantial estimated combined total economic effect on the Mississippi economy as measured by jobs, employee compensation, total output, and value-added (Table 2). Values shown for all agriculture-related sectors indicate direct effects, while all values for all non-agriculture-related sectors represent indirect and induced effects to the rest of the Mississippi economy that are attributable to agricultural and forestry production and processing in Mississippi.

Employment refers to the annual average number of full- and part-time jobs in the private and public sectors. This measure represents those employed for wages as well as self-employed people.

Agricultural and forestry activities contributed to an estimated total employment of 185,774 jobs in the state, or about 11.4 percent of all jobs in Mississippi.

Employee compensation refers to the annual monetary wages and salaries paid to employees and the self-employed and includes the value of benefits.

Agricultural and forestry activities contributed an estimated \$9.2 billion, or 11 percent of the state's total employee compensation.

Output represents the total gross sales for goods and services throughout the state.

In 2022, agricultural and forestry activities, including production and processing, directly and indirectly accounted for \$46.2 billion, or 14.2 percent, of all economic activity in Mississippi.

Value-added is the residual value of a sector's outputs after it pays for its inputs. This performance measure avoids double counting the value of an output from one sector that is used as an input in another sector. A sector's value-added is distributed as wages and salaries, rental payments, royalties from contracts, dividends from corporations, corporate profits, or indirect business taxes (such as property, excise, and sales taxes).

In 2022, agricultural and forestry activities contributed \$15.43 billion in value-added, or 10.8 percent of new wealth generation in the state.

Additionally, agricultural and forestry production and processing also generate a considerable amount of tax revenue. The tax contribution of the food and fiber system includes tax revenue for federal, state, and local governments.

The total tax contribution was estimated to be \$3.06 billion. The federal tax revenue contribution was estimated at \$2.01 billion, while the state and local government contribution equaled \$1.05 billion.

Summary

Agricultural and forestry production and processing is an estimated \$46.2 billion industry in Mississippi. These industries make a significant economic contribution to the state economy, accounting for

- 185,774 jobs (11.4 percent of all Mississippi jobs) paying \$9.2 billion in wages and salaries (11 percent of all wages and salaries in Mississippi);
- industry sales equal to \$46.17 billion, generating a value-added of \$15.43 billion; and
- \$3.06 billion in federal, state, and local tax contributions.

Thus, the agricultural and forestry production and processing sectors are a substantial contributor to Mississippi's economy.
