The Great Red Snapper Count
Project Overview

Why is this study important?
- Red snapper comprise an economically valuable and culturally relevant fishery in the Gulf of Mexico.
- The stock is currently under a rebuilding plan.
- Although the red snapper fishery is showing signs of recovery, anglers are frustrated by restrictions, such as shortened seasons.
- Stakeholders collectively desire a healthy, well-managed red snapper stock.
- A lack of abundance data hinders the best possible stock management.

Who is funding the study?
- Congress made $10 million in funding available for research projects designed to independently estimate red snapper abundance.
- After a competitive review process, Mississippi-Alabama Sea Grant awarded the $10 million for a 2-year (2017–19) project.

What is the goal of the study?
The central objective of this study is to independently (separately from NOAA Fisheries) estimate the abundance of red snapper in the U.S. Gulf of Mexico.

Who is involved in the study?
A well-integrated, multidisciplinary team of investigators, which includes leading fisheries experts from the Gulf region and beyond, is leading the project.
How will scientists develop the abundance estimate?
Scientists will use a suite of methods, including habitat classification, direct visual counts, depletion surveys, and a tagging study, across the entire U.S. Gulf of Mexico.

What are the expected outcomes of the study?
- Legislators and fishery managers will review the abundance estimate from this project and use it to make more informed management decisions.
- This will lead to:
  - calibration of the current stock assessment.
  - increased confidence in the status of the stock.
  - maximum fishery access for stakeholders.
